Pros (enhance/revolutionize)

- It enabled us to communicate anywhere around the world. (e.g. on a call from another country)
- Documentation on what happens is now easier. (e.g. a Github tracking all changes in code)
- It reduces social pressure especially for introverts. (e.g. communicating through chat rather than face to face)
- It allows more flexibility for team members as it allows self-pacing (e.g. allows you to make changes anytime in google docs).

Cons (negative)

- It's easier to procrastinate because accountability is not as strict during online teamwork compared to face to face. (e.g. collaborating on a research project)
- There is more chance of miscommunication as messages/info given online might not be as detailed as compared to given in face to face. (e.g. delegating tasks online for a project)
- The tasks done tends to get messy since most of the time the info just gets dumped unlike f2f where info gets organized before submitting. (e.g. dumping all notes into google docs as compared to summarizing and handwriting on paper)
- It's easier to be dismissive or lack empathy because it's only a human on screen and not a human across from you. (e.g. judging a work on a zoom call)

VICTORY

e.g. judging a work on a zoom call

DATE:

Pros

- It's easier to share data/ideas because it gives more time to think before sending it. (e.g. ~~suggest~~in annotating feature on google docs compared to confronting for F2F.

Cons

- Tends to give more workload during online since it's expected self-paced leading to an overload in work (e.g. instead of giving only 1 work during office hours in F2F, it can be much more and expected you to do it outside office hours.)
